Abstract- Man-made brainpower is upsetting medical care with colossal outlook changes affecting treatments, wellbeing investigation, drug research, analytic cycles, and considerably more. In this article, we underscore the use of AI-based Pregbot frameworks that perceive and take care of the necessities of patients and their families. These frameworks are basically founded on AI calculations and Natural Language Processing. We unequivocally portray a utilization case for an AI-Pregbot that helps moms, anticipating ladies, and families with small kids by offering counsel and guidelines when fitting.

Keywords- NLP and CNN Algorithm

I. INTRODUCTION

A developing number of firms are going to chatbots as a necessity. According to Gartner, over 85% of client contacts ought to be dealt with consequently by 2020. Chatbots will control shopper utilizations of AI during the following five years, predicts, Tech Emergence3. Notwithstanding, in spite of current advancements in machine and profound discovering that make chatbots reliable and equipped for offering programmed and versatile human-like discussion conduct, they actually require improvement as to supporting muddled ways of behaving. This is especially valid for the growing number of chatbot items made for way of life and health. use the telephone more habitually than other apps. As an outcome, researchers are as of now attempting to create chatbots that are controlled by AI and are savvy to the point of responding to client requests. The chatbot thought has drawn in more consideration as of late. We offer MamaBot, an AI-based chatbot that can give prompt and valuable direction to families with small kids, eager endlessly moms in a crisis.

II. LITERATURE REVIEW

A comparative study of Medical Chatbot

Chatbots are simple method for involving way for any person. Simultaneously, it is affordable or the medical services association. Tutoring going teenagers where they can discuss their diseases would be useful.

A Self Diagnosis Medical Chatbot using Artificial Intelligence

It gives Linear Design that contains Artificial Intelligence, Pattern coordinating, Disease, Query handling methods. It gives chatbot exchange's limited state chart and useful design.

Disease Prediction using Machine Learning

It gives a flowchart of infection expectation followed by datasets, highlight choice, information preprocessing, choice tree characterization, text handling, watchword coordinating.

A Medical Chatbot : a system based on ML and NLP for supporting Women and Families during pregnancy

They used our dataset for different cities of different sizes for giving the information about heart diseases.

MamaBot

This system presents AI based chatbot useful to support pregnant women about any doubt any doubts or problems. Framework LUIS Algorithm 89.3% accuracy.

III. PROPOSED WORK

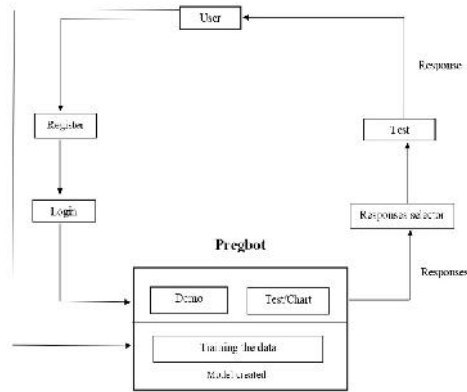

This robot was made utilizing before regular language handling procedures, yet it was less precise in giving the right reaction. To develop the PREGBOT application, which will respond to client requests, we are utilizing a Python profound learning project since profound learning procedures have worked on the precision of offering the right response.

To set this strategy in motion, we first train profound learning models with preparing information (all potential responses to questions), and each time a client poses an inquiry, the application will use this test question on the learned model to anticipate the specific solution for that inquiry.

1. ADVANTAGES

- It will be more useful for the pregnancy women.

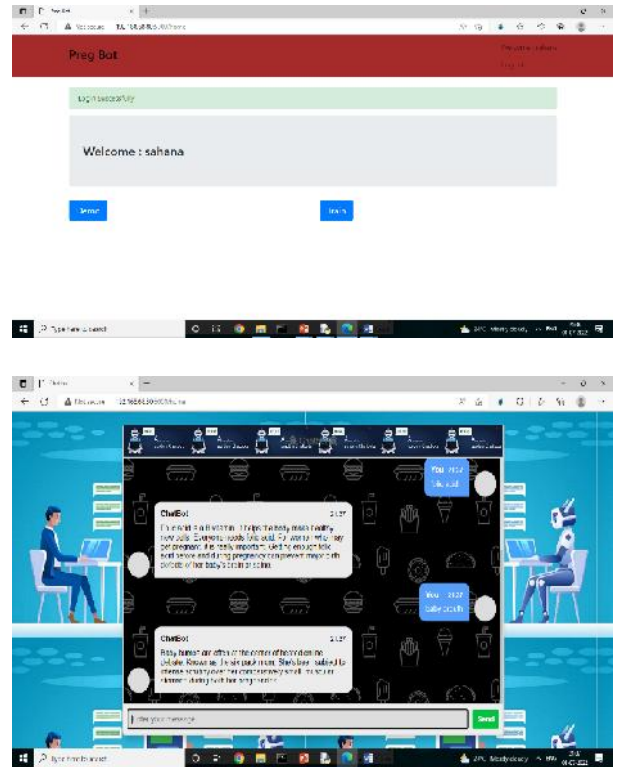

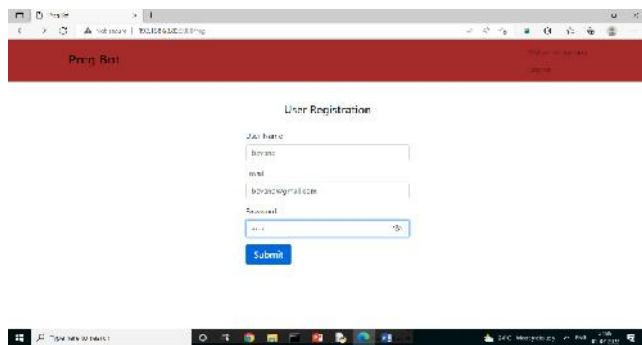

IV. SYSTEMIMPLEMENTATION

The cycle through which a hypothetical thought is transformed into a viable device is called execution. The customer division is presently enduring the worst part of obstruction and the effect on existing practices. The main stage in the making of another framework, and the client should have confidence that the new framework will work and be powerful, is the execution cycle. On the off chance that this cycle isn't arranged and made due, it can create turmoil.

The method involved with using the made framework is known as program execution. This covers movements of every kind connected with utilizing the new program. When the arranging is done, the association's primary goal is to ensure that the frameworks' techniques are working appropriately. Before the execution interaction can start, a few necessities should be fulfilled.

V. EXPERIMENTAL RESULTS

VI. CONCLUSION

In the mHealth area, chatbots can be extremely gainful for clinical experts and patients without the need to download and introduce an application. To find applicable solutions to their requests, they only need to cooperate with the bot. Chatbots can be a creative way to deal with assistance patients by conveying valuable data and administrations through a basic discussion, giving individualized care while lessening stand by times, regardless of whether they can't thoroughly supplant individuals.
